

*Chromatographic conditions for reverse phase LC-MS*

One  $\mu\text{L}$  of reconstituted standards or 5-7  $\mu\text{L}$  of reconstituted sample was injected onto an Ascentis Express C18 HPLC column ( $2.7\ \mu\text{m} \times 15\ \text{cm} \times 2.1\ \text{mm}$ ; Sigma Aldrich). The column oven and autosampler tray were held at  $30\ ^\circ\text{C}$  and  $4\ ^\circ\text{C}$ , respectively. The following conditions were used to achieve chromatographic separation: buffer A was 0.1% formic acid; buffer B was acetonitrile with 0.1% formic acid. The chromatographic gradient was run at a flow rate of  $0.250\ \text{mL min}^{-1}$  as follows: 0–5 min: gradient was held at 5% B; 2–12.1 min: linear gradient of 5% to 95% B; 12.1–17.0 min: 95% B; 17.1–21.0 min: gradient was returned to 5% B.
